Climate change action anything but hot air on the Central Coast as Living Green Designer Homes go Climate Neutral™.

CENTRAL COAST, NSW -- While international UN delegates discuss climate change in Bali, back home, Central Coast eco-construction company Living Green Designer Homes are taking real action to reduce the company's environmental impact, provide low emission homes and become completely Carbon Neutral.

Craig Riddle, accredited HIA Greensmart builder and MBA member established Living Green Designer homes in an effort to pursue his passion for creating affordable energy efficient housing options for consumers.

In achieving his carbon neutral worksite, Craig and Living Green Designer Homes are bringing something completely revolutionary to the building industry - housing design and construction that centres on the principle of an energy efficient, environmentally friendly model that allows for the production of a carbon neutral, climate friendly home that is totally affordable .

Climate Friendly, a business dedicated to climate neutrality, integrates climate change strategy, carbon foot printing, energy efficiency advice, Greenpower supply, and the highest quality renewable energy credits and communications support.

In essence, Living Green Designer Homes has created for the consumer a construction whose emissions of green house gasses are minimised and then offset, thereby creating no adverse affect on the planet throughout the stages of design, construction and completion, at no cost to the consumer.

Living Green Designer Homes has been certified by Climate Friendly as a carbon neutral workplace - this encompasses not only the Living Green offices, but all individual Living Green Designer Homes construction sites.

Working in unison with Climate Friendly, Living Green Designer Homes have sought simple and effective ways to assist the business to neutralise its 'carbon footprint.'

This is achieved by Climate Friendly working with a company and calculating the emissions produced, as well as providing and encouraging energy efficient strategies and funding high quality, independently verified renewable energy projects that prevent the same amount of greenhouse gas emissions as their clients produce

Since 2003, Climate Friendly has helped its customers neutralise more than 50,000 tonnes of greenhouse gas emissions in Australia and worldwide.

"By using the latest in sustainable and lightweight building products, cost efficient design principles and encouraging a reduced building footprint, we are able to achieve quality homes with superior energy efficiency at a far lesser cost than our competitors," said Craig.

"What Mr Riddle and his team at Living Green Designer Homes are doing is a massive achievement," said Climate Friendly founder and CEO Joel Fleming. "They are leading the way when it comes to housing design and construction based on environmental principles."

"Our core principles and philosophy are simple. By streamlining the process, our housing solutions become environmentally friendly as well as more accessible for first home buyers, young families and retirees. The Living Green Designer Homes model allows for a carbon neutral home that is totally affordable," said Craig Riddle.
