Local green builder gets the Federal Government's thumbs up

Central Coast business, Living Green Designer Homes has been given the Australian Government's seal of approval with the Hon. Belinda Neal, Member for Robertson, applauding the company's commitment to the environment and innovation in developing a system to build affordable, carbon neutral, energy efficient housing options for the mass market.

With issues such as climate change and global warming becoming a mainstay in politics today, the Government is continually in search of sustainable, green solutions to our typically environmentally unfriendly way of life.

"Living Green Designer Homes offers consumers cost effective housing solutions which are not only carbon neutral, but have significant ongoing energy efficiency benefits, said Ms Neale.

"This is the way of the future for residential development and to have this innovative building model, which has the potential for major impact in the global market, developed here on the Central Coast is a major coup," she added.

"By using the latest in sustainable and lightweight building products, cost efficient design principles and encouraging a reduced building footprint, we are able to achieve carbon-neutral, quality homes with superior energy efficiency, at a much lower price than most options on the market," said Living Green Designer Homes' Craig Riddle, an HIA Greensmart Professional and member of both the Green Building Council of Australia and the Master Builders Association.

Living Green Designer Homes has recently completed their first home on the Central Coast, located at 5 Gheri Avenue, Wamberal.

This property has caught the attention of Ms Neal who is pleased to show her support of a locally based builder who has created such an impressive alternative to the standard resource and energy hungry dwelling.

Mr Riddle believes Living Green Designer Homes' core principles set them apart from their competitors.

"Our philosophy is simple. Through streamlining the process, housing becomes environmentally friendly as well as more accessible for first home buyers, young families and retirees," said Craig. "Our model allows us to produce a carbon neutral home that is totally affordable and contemporary in design."

Living Green Designer Homes strive to construct homes using renewable and sustainable resources that are mindful of both energy and water efficiency and subsequently, result in a lesser impact on the world's resources.

Living Green Designer Homes are continually working towards further reducing the company's environmental impact, achieving carbon positivity in both their constructions as well as their offices.
